Linear algebra is essential in analysis, applied math, and even in theoretical mathematics. This is the point of view of this book, more than a presentation of linear algebra for its own sake. This is why there are numerous applications, some fairly unusual.

Problems (1) Give a geometric description of a single linear equation in three variables. Then give a geometric description of the solution set of a system of 3 linear equations in 3 variables if the system (a) is inconsistent. (b) is consistent and has no free variables. (c) is consistent and has exactly one free variable.

So we're down to the two cases where  $x = 1$  and one of  $y$  or  $z$  equals 1 and the other equals 0. In this case both sides equal 1. So  $x(y + z) = (x + y)z$  in all eight cases. Exercise 6: Prove that if two homogeneous systems of linear equations in two unknowns have the same solutions, then they are equivalent.

Linear algebra is, after all, motivated by systems of linear equations. A novel feature of Hoffman and Kunze is that most of their theorems and proofs generalize the concepts of the real/complex numbers into arbitrary "fields" of "scalars."
