Molecular Visions (Organic, Inorganic, Organometallic)

In organic chemistry and biochemistry, a side chain is a chemical group that is attached to a core part of the molecule called "main chain" or backbone. The side chain is a hydrocarbon branching element of a molecule that is attached to a larger hydrocarbon backbone. It is one factor in determining a molecule's properties and reactivity. A side chain is also known as a pendant chain, but a ...

Oxygen is a chemical element with symbol O and atomic number 8. It is a member of the chalcogen group on the periodic table, a highly reactive nonmetal, and an oxidizing agent that readily forms oxides with most elements as well as with other compounds. By mass, oxygen is the third-most abundant element in the universe, after hydrogen and helium. At standard temperature and pressure, two atoms ...

Alkyl halides are organic compounds containing a halogen atom bonded to a carbon atom. They are commonly used in organic synthesis. The general formula is $C_nH_{2n+2}O$. Alkyl halides are used in a variety of applications, including as solvents, reagents, and intermediates in organic synthesis. They are also used in the production of polymers and pharmaceuticals. Alkyl halides are classified into primary, secondary, and tertiary based on the number of carbon atoms bonded to the halogen atom. They are also classified into saturated and unsaturated based on the presence of double bonds. Alkyl halides are highly reactive and can undergo a variety of reactions, including substitution and elimination reactions. They are also used in the synthesis of alcohols, aldehydes, and ketones. Alkyl halides are used in the synthesis of many important organic compounds, including drugs, dyes, and plastics. They are also used in the production of many common household products, such as disinfectants and pesticides. Alkyl halides are highly toxic and can be harmful to the environment. They should be handled with care and disposed of properly.
